Don’t Wait to Vaccinate

Doctors recommend that girls and boys get vaccinated against HPV at age 11 or 12. The series should be completed by age 13.

Age Matters
When you vaccinate your child on time, you help protect them from HPV cancers. The HPV vaccine is most effective when given at age 11 or 12. Cancer protection decreases as age at vaccination increases.

Cancer Prevention Goes Down with Delayed Vaccination

Early
Ages 9-10
2 Doses
6-12 months apart

On Time
Ages 11-12
2 Doses
6-12 months apart

Critical
Ages 13-14
2 Doses
6-12 months apart

Last Chance
Ages 15-26
3 Doses
1st dose at visit one
2nd dose 1-2 months later
3rd dose 6 months after 2nd
